Professional Summary

Data Science graduate student who sees data as more than rows and columns, with experience cleaning and analyzing 50K+ messy real-world records, building dashboards, performing SQL/Python-based analysis, documenting workflows, and turning raw data into insights teams can trust and use. Skilled in SQL, Python, Pandas, NumPy, Matplotlib, scikit-learn, Tableau, HTML, JavaScript, and Streamlit, with experience connecting technical patterns to the human and operational context behind analytics, machine learning, reporting, and web-based data applications.

Skills

Programming & Querying: Python, R, Advanced Excel

Data Analysis: Data Manipulation, Data Collection, Data Cleaning, EDA, Data Validation, Data Quality Checks, KPI Analysis

Statistics & Research: Regression Analysis, Distribution Analysis, Hypothesis Testing, Quantitative & Qualitative Analysis

Python Libraries: Pandas, NumPy, scikit-learn, Matplotlib, Plotly

Databases: Relational Databases, SQL Joins, Aggregations, Window Functions, Schema Validation

Machine Learning & AI: Model Evaluation, Feature Engineering, Classification, LLM Evaluation, LoRA/PEFT Fine-Tuning

Visualization & Reporting: Tableau, Power BI, Dashboards, Data Storytelling, Analytical Reporting

Tools & Workflow: Git, MLflow, DVC, Docker, AWS EC2/S3/ECR, Linux, HTML, JavaScript, Streamlit, API Connectivity

Work Experience

Sree Nirman

May 2023 – Apr 2024

Machine Learning Engineer Intern (Analytics & ML)

Hyderabad, India

- Started with 50K+ inconsistent construction records where missing values, schema issues, and outliers were hiding the real cost story, then cleaned and transformed the data using SQL, Python, Pandas, and NumPy, improving reporting reliability by 30%.
- To understand why project costs were drifting, analyzed 4 major areas including material, labor, timeline, and cost data, uncovering budget variance patterns and operational inefficiencies that improved cost-control visibility by 15%.
- Built and compared 10+ MLflow experiments for regression-based cost estimation, using feature engineering, RMSE, and R^2 to identify which cost drivers had the strongest impact on project planning decisions.
- Turned analysis into Tableau dashboards, stakeholder reports, and a FastAPI model service on AWS EC2, documenting the workflow so insights and model outputs could be reused in future planning cycles.

Avanthi High School

Apr 2022 – Jan 2023

Data Analyst Intern (Analytics & Machine Learning)

Warangal, India

- Started with 50K+ financial and operational records across hostel, academics, and sports departments, then cleaned and validated the data using Python, Excel, and statistical analysis, improving data accuracy by 30%.
- To find where spending was quietly leaking, analyzed trends and budget variance across 3 departments, identifying over-budget categories and 10–15% potential cost-saving opportunities for administrative planning.
- Built monthly dashboards and reports tracking department-wise expenditure, budget variance, and category-level spending trends, reducing reporting turnaround time by 20% and giving stakeholders clearer financial visibility.
- Used regression/distribution analysis and documented cleaning steps, assumptions, formulas, and reporting logic across monthly workflows, making the analysis easier to audit, repeat, and use in future budget reviews.

Assistantship

University of Missouri-Kansas City

Aug 2025 – Present

Information Services Lab Assistant

Kansas City, MO

- Mentored undergraduate students with data analysis workflows and guided them through statistics and EDA while improving the quality, consistency, and reproducibility of their analytical work.
- Reviewed and resolved reproducibility issues while maintaining lab system documentation to improve its accuracy and consistency.

Education

University of Missouri-Kansas City

Aug 2024 – May 2026

Master of Science in Computer Science - Data Science

GPA: 3.96

- Relevant Coursework: Data Science, Statistical Learning, Database Management Systems, Cloud Computing, Generative AI

Projects

Genre-Controlled Story Generation using LoRA

Python, PyTorch, Transformers, PEFT, QLoRA

- Built a genre-controlled story generation system using Gemma 3-1B with QLoRA/PEFT, training on 700+ curated prompt-story samples across 3 genres: fantasy, romance, and sci-fi. Designed the full instruction-tuning pipeline with prompt formatting, preprocessing, tokenization, and held-out evaluation to make the workflow reproducible from raw data to generated stories.
- Evaluated base vs. fine-tuned outputs using validation loss, perplexity, genre fidelity, coherence, repetition, format following, and LLM-as-judge scoring, reducing perplexity from about 45.9 to 27.6 in one final run. Built a Streamlit web app where users could select genre, enter prompts, generate stories, and adjust temperature, top-p, and top-k, while documenting 3 failure cases: repetition, weak endings, and genre drift.
